Transition to adulthood: the needs and concerns of adolescents with the most common congenital cardiovascular malformations. Adolescents with congenital cardiovascular malformations (CVM) have a unique set of needs related to their condition and the transition to adulthood. This study provides the first review of these needs and concerns among adolescents with the most common CVM. Results from this study show that adolescents' perceptions of their quality of life are generally excellent. Participants reported that their need for medical expertise to optimize their health was most pronounced. They also had a strong desire to engage in decision-making about their care. Participants highlighted a lack of meaningful discussions about their condition during childhood and reported a desire for information about the long-term consequences of their condition. Lastly, these adolescents reported a strong desire for a relationship with other people with CVM, with whom they could share their experiences. These findings will be useful to clinicians and researchers who are developing interventions to support adolescents with CVM as they make the transition to adulthood.

Rotherham Youth Services Association The Rotherham Youth Services Association (RYSA) is a community-based organisation, which provides a range of services for young people in South Yorkshire. RYSA was established in February 2012 to replace the previous organisations, Rotherham Young People's Development Service (RYPDS) and Rotherham Learning Disabilities Association (RLDA), and is now part of the Rotherham Partnership, a local authority regeneration partnership. Services provided RYSA provides a range of services that support young people with a range of needs and capabilities. These include: Peer outreach workers. Service Coordinators. Advice and support, which includes outreach workers and family and friend support groups. Parental support A number of drop-in services A 12-week intensive Outreach Education Programme. A Saturday morning educational programme. A number of targeted support programmes In May 2012 RYSA was given a five-year contract to run the whole of Rotherham's Learning Disability Support Service.

Conventional wireless communication systems are generally susceptible to problems related to signal fading and multi-path effects. The severity of these problems may vary from one geographic area to another, even within a cell of a base station, depending upon the geographic structure of the coverage area. For example, multi-path problems are typically more pronounced for signals that are transmitted at low frequencies, such as signals transmitted in the 700 MHz band. In order to overcome these problems, many communication systems utilize a diversity scheme to improve the reliability of the communication link by mitigating these problems. For example, one such scheme involves allowing the communication link to utilize two or more physical transmit/receive antennas. Specifically, by employing diversity using two or more antennas, the probability that the communication link will suffer a more severe attenuation due to any one of the multiple paths is reduced. Furthermore, by employing multiple antennas, communication quality and bandwidth are increased. More specifically, one type of diversity scheme is known as spatial diversity. Spatial diversity attempts to realize diversity by providing a receiving station with the capability to receive transmitted data on multiple antennas, each of which is spaced apart by a distance corresponding to a given spacing between the adjacent elements of a two dimensional array. Consequently, the receiving station may determine whether the link quality is more severely attenuated at a given time using a measurement taken using one of the antennas. More specifically, the receiving station may measure the channel conditions as well as the level of interference on the channel using one of the two or more spaced apart antennas, which are appropriately spaced for diversity purposes. Thus, if the link is received on two spaced apart antennas at two times, it is assumed that the channel conditions may have changed. Another type of diversity scheme is known as temporal diversity 2d92ce491b
