Nickel, a major component of many alloys, is often important in their presence. For instance, steel containing a greater amount of nickel is often more resistant to corrosion and oxidation than other steels. Accordingly, it is usually necessary to measure the nickel content in the steels used in various commercial and industrial applications. The nickel content may be measured directly by chemical analysis techniques, for instance, atomic absorption, and neutron activation, which are destructive analysis techniques. In addition, non-destructive techniques, such as x-ray fluorescence, inductively coupled plasma, and optical techniques have been used. Unfortunately, chemical analysis methods are often slow, complex and expensive and have substantial errors. Further, the other methods often require a significant sample for testing, are limited to the physical state of the sample, and are not readily amenable to automation. It is therefore desirable to have a non-destructive, rapid, and reliable method of determining nickel content in alloys. It is known to include heating components in automotive vehicles for selectively heating a passenger compartment. Typically, the heating components may be turned on or off using a fuel control relay, which is wired to the heater core with a control wire. However, this method requires the addition of a cable to the wiring harness and is not compatible with wiring harnesses used to provide other vehicle functions. It is also known to provide a heating system in which a controller is integrated with the heater core and is wirelessly connected to a module installed in the vehicle compartment. The wireless connection relies on the use of a standard radio frequency (RF) module, which connects the controller to the module in a manner that the controller can communicate with the module to turn the heater on and off. The standard RF module does not limit the potential location of the controller or its communication interface. This approach is limited in its application as it requires a connection to the module in the vehicle compartment. In addition, the heater controller and RF module must be designed to communicate with the standard RF module, which limits the range and positioning of the heater controller and RF module. There is thus a need for a system for selectively heating a passenger compartment that does not require the use of a dedicated wiring harness and
